Outline

- Background
- Methods and Data
- Preliminary results

Background

- Importance of young children's development
- Target 4.2 in SDGs for young children under age five
- Covid-19's impact on young children
 - Direct
 - lacking access to early care and education
 - lacking regular health care
 - increased living in poverty
 - more suffering from malnutrition, etc.
 - Indirect
 - increased parental stress
 - increased harsh punishment
 - poorer parent-child interactions
- Little is known about the capacity of the household environment for protecting young children from the Covid-19

Objectives

- Assessing % of young children (< 5 years) living in the households with preparedness for Covid-19 in low- and middle-income countries (LMICs) with available data
- Assessing associated socioeconomic inequalities

Outline

- Background
- **Methods and Data**
- Preliminary results

Methods

Definition of household with preparedness for Covid-19

WHO/CDC guideline on household prevention or home care

- Prepare for possible illness
 - ✓ Room for quarantine
 - ✓ Adequate sanitation to avoid direct contact with stool, urine
 - ✓ Can separate waste from the patient
 - ✓ Masks for patients and caregivers
- Take preventive actions
 - ✓ Soap or detergent for hand washing and room cleaning
- Stay informed and in touch
 - ✓ Communication with health care providers and emergency contacts
 - ✓ Obtaining up-to-date info

Methods

Definition of household with preparedness for Covid-19

A household is prepared for covid-19 if

Conditions:

1. Space for quarantine +
2. Capacity for performing hand hygiene +
3. Adequate toilet +
4. Good communication +
5. Being informed

Variables

1. Household size and # of sleeping rooms
2. Handwashing facility with water & soap
3. Toilet condition
4. Ownership of phones, or radio, or TV
5. Listening to radio, or watching TV, or reading newspapers

Data - Search for Household Surveys

- International Household Survey Network
 - Informal network of household surveys conducted in low- and middle-income countries,
 - Improving the availability, accessibility, and quality of survey data and encouraging data use for evidence-based decision making,
 - Supported by its members such as the WHO, World Bank, or USAID (US), or DFID (UK), etc.

<https://www.ihsn.org/about>

Data - Search for Household Surveys

- Keywords search through the network (e.g. sleeping room, water, sanitation, hygiene, soap, toilet, radio, TV)
 - nationally-representative
 - publicly accessible
 - since 2016 (tradeoff: accuracy vs. availability)

Data - Search for Household Surveys

Countries included in the study (43)

Year	Country #	Income group	Country #	Region	Country #
2016	10	Low-income	14	East Asia and Pacific	9
2017	11			Europe and Central Asia	4
2018	16	Lower-middle income	21	Latin America and the Caribbean	3
2019	6			South Asia	5
Total	43	Upper middle income	8	Sub-Saharan Africa	19
				Middle East and North Africa	3

Data - Search for Household Surveys

- Demographic and Health Surveys (DHS)
 - Nationally-representative household surveys
 - Every five years in over 90 LMICs since 1985
 - Variables on population, child and maternal health and nutrition
 - Funded by USAID and implemented by ICF
- Multiple Indicator Cluster Surveys (MICS)
 - Nationally-representative household surveys in more than 100 LMICs since 1995
 - Focusing on child and maternal health and well-being
 - Funded and implemented by UNICEF

Data - Search for Household Surveys

- DHS and MICS are widely used for tracking progress in MDGs and SDGs by international organizations and countries
- DHS and MICS are highly comparable (WHO)
 - Survey design: two-stage stratified cluster sampling design
 - Survey implementation
 - Measurement strategies

Measuring “preparedness for Covid-19”

(1) Quarantine condition

Step 1: Constructing a variable of # of persons per sleeping room (“personroom) using two variables below

(a) # of household members who usually sleep at home

(b) # of sleeping rooms of a household

Step 2: Constructing a dummy variable indicating good condition for quarantine

- pooling the data of “personroom” from all countries, then
- selecting mean of its distribution as the cutoff point for good condition
“quarantine” = 1 if “personroom” < mean (3.38), 0 otherwise
- sensitivity tests: the 25th percentile (2), and the 75th percentile (4)

Measuring “preparedness for Covid-19”

(2) Availability of handwashing facility with water and soap

“hygiene” = 1 if a household has handwashing facility with water and soap,
= 0 otherwise

(3) Adequate sanitation

“toilet” = 1 if toilet not shared with other households AND excreta safely disposed or treated or transported,
= 0 otherwise

Measuring “preparedness for Covid-19”

(4) Household ownership of phones, radio, and TV

“hhict” = 1 if a household has radio, or TV, or phones (fixed line or mobile)
= 0 otherwise

(5) Mother’s exposure to mass media

“mediaexposure” = 1 if a mother reads newspapers, OR listens to radio, OR watches TV
at least once a week,
= 0 otherwise.

Measuring “preparedness for Covid-19”

Generate a summary measure for the five dummy variables

(1) Constructing a dummy variable

“prepared” = 1 if “quarantine” =1 AND “hygiene”=1 AND
“toilet” = 1 AND “hhict” =1 AND
“mediaexposure”=1
= 0 otherwise

(2) Construct a variable to assess a household score on preparedness

Summing up the value across all five dummy variables, with scores ranging 0—5

Analytical framework

	Prepared	Quarantine	Hygiene	Toilet	Phone/radio/TV	Media exposure
(1) Estimating %						
<i>Country-level</i>	X	X	X	X	X	X
<i>Aggregate-level</i>	X	X	X	X	X	X
Region						
Income group						
(2) Assessing inequalities						
<i>Within-country</i>						
Residential area	X	X	X	X	X	X
Poverty/wealth status	X	X	X	X	X	X
Subnational	X	X	X	X	X	X
<i>Aggregate-level</i>						
Region	X	X	X	X	X	X
Income group	X	X	X	X	X	X

Analyzing “preparedness for Covid-19”

- Estimating aggregate-level of % of young children living in households with preparedness
 - Average of country-level estimate of % with population weights
 - Random-effect meta analysis (e.g. McKinnon et al. 2014 Lancet GH)

Analyzing “preparedness for Covid-19”

- **Measuring inequalities**

Absolute difference in % of young children living in prepared households

- Within country
 - by residential area (rural vs. urban)
 - by poverty/wealth status (e.g. poorest 20% vs. richest 20%)
 - subnational inequality
- Cross-country
 - by region
 - by income group

Issues on using wealth quintile

- Person per sleeping room, radio, TV, phones, toilet are included in constructing wealth quintile variable
- Suggestions from previous studies
 - Wealth indices remain useful proxies for water or toilet
- Our approach: two options
 - (1) Using existing wealth quintile
 - (2) Reconstructing wealth quintile by excluding TV, radio, toilet, persons per sleeping room

Methods

- Limitations

- (1) Data before 2019

- (2) Self-reported information

- (3) Wealth index measure including outcome variables

- (4) Not representative at the aggregate level

Outline

- Background
- Methods and Data
- Preliminary results

Figure 1: % of young children living in prepared households (2018 & 2019)

Figure 2 % of young children living in households with any ownership of radio, TV, landed/mobile phone (2018 & 2019)

Figure 3 % of young children living in households with good quarantine condition (2018 & 2019)

Figure 4 % of children living in households with mother exposed to mass media at least once a week (2018 & 2019)

Figure 5 % of young children living in households with handwashing facilities, water, soap (2018 & 2019)

Figure 6 % of young children living in households with adequate toilet (2018 & 2019)

Figure 7 Disparities between young children living in rural and urban areas (2018 & 2019)

Figure 8 Disparities between young children living in the poorest and the richest wealth quintiles (2018 & 2019)
